

# **FOLDOUT TOOLKIT**

**DOCUMENTATION**

**Foldout Toolkit** - allows you to group fields into convenient sections, add names to them, working with any access modifiers, field types, and total number.

## How to use?

At the beginning, you need to add **using static FoldoutAttribute** to the script where it will be used.

```
1 using UnityEngine;
2 using static FoldoutAttribute;
3
4 public class Sample : MonoBehaviour
5 {
```

Now you have these commands at your disposal:

## [Foldout]

You can create a folder by typing this command above the desired fields and **(important!)** giving it a unique name.

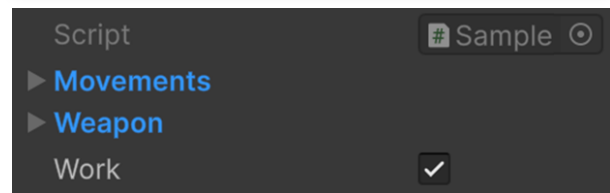

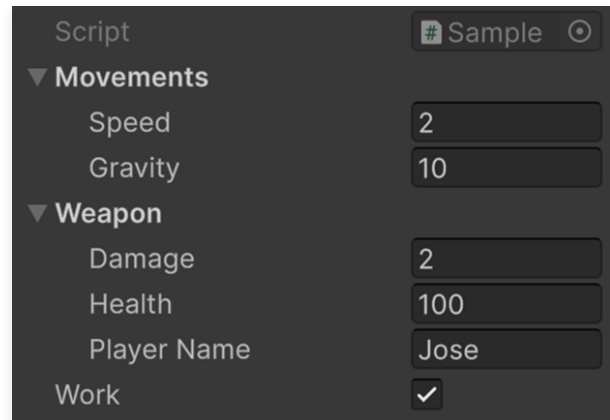

```
1 using UnityEngine;
2 using static FoldoutAttribute;
3
4 public class Sample : MonoBehaviour
5 {
6     [Foldout("Movements")]
7     public float speed = 8;
8     public int gravity = 10;
9 }
```

Each new folder finishes the previous one, but to finish the folder and continue writing fields arbitrarily, you need the following command.

## [EndFoldout]

This command completes the folder and the fields continue in the normal order.

```
1 using UnityEngine;
2 using static FoldoutAttribute;
3
4 public class Sample : MonoBehaviour
5 {
6     [Foldout("Movements")]
7     public float speed = 8;
8     public int gravity = 10;
9
10    [Foldout("Weapon")]
11    public float damage = 15;
12    public float health = 100;
13    public string playerName = "Jose";
14    [EndFoldout]
15
16    public bool work = true;
17
```

## Required resources

**FoldoutSectionEditor.cs** - the main script that is responsible for the behavior and rendering of folders.

**FoldoutAttribute.cs** - this defines the **FoldoutAttribute** attribute to group fields in the inspector under a common heading, and also the **EndFoldoutAttribute** to mark the end of such a group.

## Some information

Works with any version of **Unity**. You can contact me by:
